

# **Assignment**

## **Technologies used**

1. NodeJS
2. ExpressJs for server
3. Angular 6 for front-end
4. Bootstrap for Angular for Design
5. Heroku for deployment
  - a. <https://fetchgitissues.herokuapp.com>

# WebApp

## 1. The landing page:

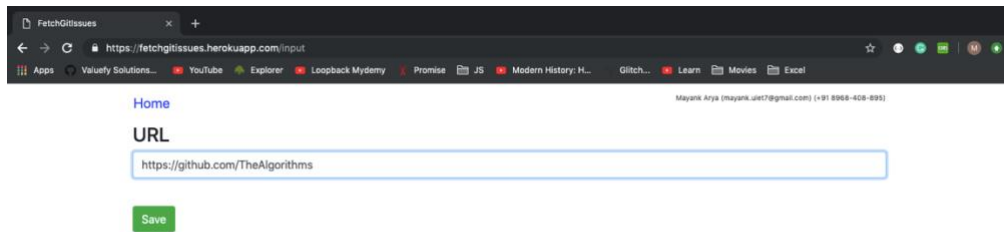

- a. It is what parentElement component refers to in the code. It contains a form with an input box to enter an URL and a placeholder. Looks like this:

## 2. Upon entering a random string, it gives error:

### 3. Upon entering a valid URL, like this:

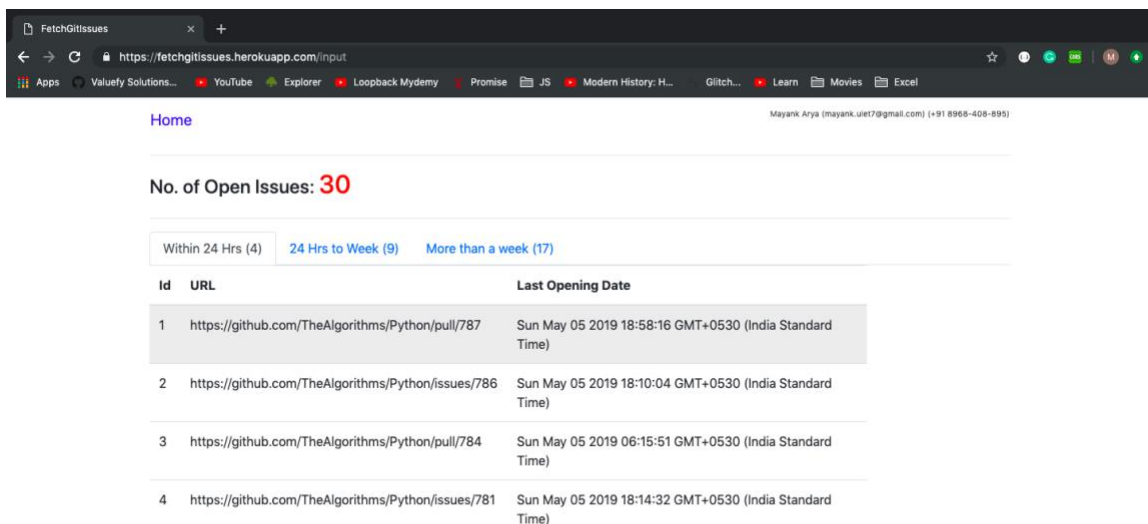

The screenshot shows a web browser window with the URL `https://fetchgitissues.herokuapp.com/input`. The page has a dark header with a "Home" link and a user profile. Below the header, there is a "URL" label and a text input field containing the URL `https://github.com/TheAlgorithms`. A green "Save" button is located below the input field.

### 4. List of Issues page opens:

It is what `childElement` component refers to in the code. It contains:

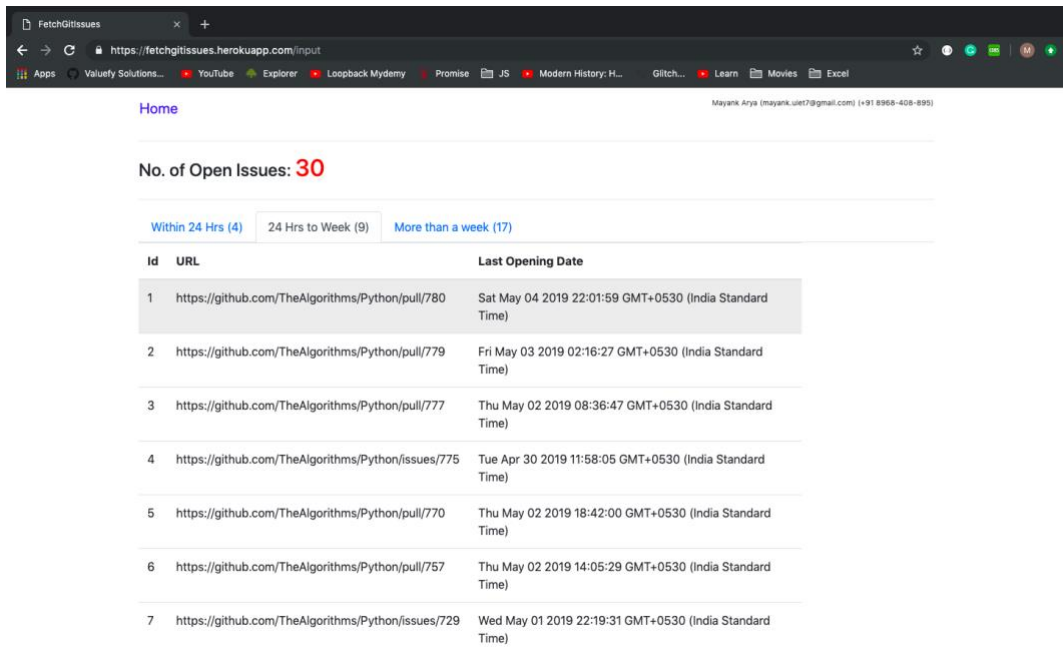

- a Home button to go back to the form page
- No. Of Open Issues: `<number>`
- 3 Tabs: each containing a table having an index, URL link of issue and last opened date.
  - Tab 1 contains table with issues opened within 24 hrs.*

The screenshot shows the "List of Issues" page. At the top, there is a "Home" link. Below it, the text "No. of Open Issues: 30" is displayed. There are three tabs: "Within 24 Hrs (4)", "24 Hrs to Week (9)", and "More than a week (17)". The "24 Hrs to Week (9)" tab is selected. Below the tabs is a table with the following data:

Id	URL	Last Opening Date
1	<a href="https://github.com/TheAlgorithms/Python/pull/787">https://github.com/TheAlgorithms/Python/pull/787</a>	Sun May 05 2019 18:58:16 GMT+0530 (India Standard Time)
2	<a href="https://github.com/TheAlgorithms/Python/issues/786">https://github.com/TheAlgorithms/Python/issues/786</a>	Sun May 05 2019 18:10:04 GMT+0530 (India Standard Time)
3	<a href="https://github.com/TheAlgorithms/Python/pull/784">https://github.com/TheAlgorithms/Python/pull/784</a>	Sun May 05 2019 06:15:51 GMT+0530 (India Standard Time)
4	<a href="https://github.com/TheAlgorithms/Python/issues/781">https://github.com/TheAlgorithms/Python/issues/781</a>	Sun May 05 2019 18:14:32 GMT+0530 (India Standard Time)

ii. Tab 2 contains table with issues opened between 24hrs and a week.

FetchGitIssues

5. If the entered Git link is invalid or belongs to a private repo, an alert is generated.

6. If the Git link belongs to a public repo but that repo has no open issues, then such an alert is generated (*to generate this alert I had to hardcode this value thus done on localhost:4200*).

## **Summary**

*Although the code is thoroughly commented, here is a quick summary of what is happening around inside.*

How the app really works.

1. In the server directory is a file **server.js**, which uses express to start a server which either listens to a port assigned to it by the production environment or port: 3000.

*To run the server enter command **node .***

*This will log **server started...** in the console.*

2. In the client directory is the Angular code.

Now we have two components viz.

***parentElement*** and ***childElement***.

And one service file which contains the code for hitting GIT-API.

2a. In parentElement component is a form which takes a URL as input and upon clicking save, this changes the value of a variable which controls the visibility of parentElement or childElement.

2b. Now the childElement is displayed, which basically contains the list of issues for that git repository.

**2c.** This childElement contains the business logic for hitting the GIT-API with the modified URL in service file (modified to a format accepted by GIT-API).

**2d.** From the response, the issues\_url is fetched modified to only fetch open issues and again the function in service file is hit.

**2e.** This response contains all the issues which are then counted and arranged into different arrays, each for issues opened within 24Hrs, between 24Hrs and a week and more than a week ago.

**2f.** These arrays and count variable are two way binded with the html and thus the html or view is populated accordingly.
